

AP Calculus – How to Navigate FRQs

Name: Key

Particle Motion

When I am asked to find/do this... (question being asked)	I'm going to use... (strategy/equation/formula)				
Given the position function, find the velocity function.	$v(t) = x'(t)$				
Given the position function, find the acceleration function.	$a(t) = x''(t) = v'(t)$				
Given the position function, find the total distance traveled	$v(t) = 0$ $t = \text{crit values}$ <table border="1" style="display: inline-table; vertical-align: middle;"> <tr> <td>t</td> <td>$x(t)$</td> </tr> <tr> <td></td> <td>find abs value of change in position (add)</td> </tr> </table>	t	$x(t)$		find abs value of change in position (add)
t	$x(t)$				
	find abs value of change in position (add)				
Given the velocity function, find the total distance traveled	$\int_a^b v(t) dt$				
Given the position function, find the displacement of the particle	$x(b) - x(a)$				
Given the velocity function, find the displacement of the particle	$\int_a^b v(t) dt$				
When is the particle speeding up/slowing down?	Speed up $v(t), a(t)$ same signs slow down $v(t), a(t)$ dif signs				
When is the particle moving to the left/right?	$v(t) \text{ pos} \rightarrow \text{right}$ $v(t) \text{ neg} \rightarrow \text{left}$ $v(t) = 0$				
When is the particle at rest?	$v(t) = 0$				

Given the position function, find the average velocity	$\frac{x(b) - x(a)}{b - a}$
Given the velocity function, find the average velocity	$\frac{\int_a^b v(t) dt}{b - a}$
Given the velocity function, find the average acceleration	$\frac{v(b) - v(a)}{b - a}$
Given the acceleration function, find the average acceleration	$\frac{\int_a^b a(t) dt}{b - a}$
When does the particle change direction?	$v(t) = 0$ and $v(t)$ changes signs
Find position of a particle given velocity and an initial position value	$x(b) = x(a) + \int_a^b v(t) dt$
Find the position of the particle at the time it changes direction	$v(t) = 0$ $t = A$ $x(A) =$
Given the position function, at what time is the average velocity equal to the instantaneous velocity?	$\frac{x(b) - x(a)}{b - a} = x'(t)$

Function Behavior

When I am asked to find/do this... (question being asked)	I will justify with this reason... (precise & concise)
Given $f(x)$, find the relative extrema $f'(x) = 0$ $f'(x)$	rel max $\rightarrow f'(x)$ goes pos to neg rel min $\rightarrow f'(x)$ goes neg to pos $\left. \begin{array}{l} f''(A) > 0 \uparrow \uparrow \text{ min} \\ f''(A) < 0 \downarrow \downarrow \text{ max} \end{array} \right\} \text{2nd Der Test}$
Given $f(x)$, find the absolute extrema $f'(x) = 0$ x $f(x)$	yields highest/lowest value of $f(x)$ * check endpoints
Given $f(x)$, find where the function is increasing/decreasing $f'(x) = 0$ $f'(x)$	inc $\rightarrow f'(x)$ pos dec $\rightarrow f'(x)$ neg
Given $f(x)$, find where the function has a point of inflection $f''(x) = 0$ $f''(x)$	POI where concavity changes
Given $f(x)$, determine intervals of x concave up/concave down $f''(x) = 0$ $f''(x)$	CC \uparrow : $f''(x)$ pos CC \downarrow : $f''(x)$ neg
Determine if a linear approximation is an overestimate or underestimate	CC \uparrow below CC \downarrow above
Find a horizontal/vertical tangent line of $f(x)$	Hor: $f'(x) = 0$ $y = \#$ Vert: where $f'(x)$ is undefined $x = \#$
